A. Brebbia 2000 Featuring contributions from a range of professionals involved in the field of smart structures and materials, this volume contains the proceedings of the Second International Conference on Computational Methods for Smart Structures and Materials. Particular emphasis is placed on the application of computational methods to model, control and manage behaviour, and topics covered include sensor and actuator technologies, adaptive materials, physical systems modelling and analysis, active and passive control strategies, testing and verification, and analysis tools.

Computational Aspects of Nonlinear Structural Systems with Large Rigid Body Motion Jorge A. C. Ambrósio 2001 Published as an outgrowth of a July 2000 NATO Advanced Research Workshop, this volume brings together work representing the various generally non-interacting scientific communities concerned with the workshop topic, in the interests of generating some cross-talk. The field has seen some major

recent developments, some finding their way into commercial, general purpose software intended for complex industrial applications. Thirteen contributions consider four major themes: flexible multibody systems, finite element procedures for structural systems with large rotations, numerical integration methods for rigid and flexible systems, and advanced methods in systems with large rigid body motion. The contributors are based in France, Italy, Germany, Greece, Portugal, Poland, the US, and Australia. Author index only. Annotation copyrighted by Book News, Inc., Portland, OR.

Deployable Structures Charis J. Gantes 2001 Deployable structures are prefabricated and can be transformed from a closed, compact configuration to a predetermined, expanded form in which they are stable and can carry loads. This theoretical and practical discussion of deployable structures formulates and solves the complex engineering design problems with which they are associated.

Space Structures Subramanian Narayanan 2006 Space Structures are economical and aesthetically pleasing in appearance. They provide a unique solution for covering large column free areas. This book gives a state of the art presentation of the analysis, design and construction of space structures. The author synthesizes data currently available with his original and exhaustive research to produce the definitive book on space structures. Principal features and topics of the book include: Analysis, design and construction of various types of space structures Nodes and jointing systems Approximate methods of analysis Concepts are explained th.

Structures and Architecture Paulo J. Cruz 2013-06-27 Although the disciplines of architecture and structural engineering have both experienced their own historical development, their interaction has resulted in many fascinating and delightful structures. To take this interaction to a higher level, there is a need to stimulate the inventive and creative design of architectural structures and to persua

Steel Structures Jerome S. B. Iffland 1989 Proceedings of sessions at Structures Congress '89, held in San Francisco, California, May 1-5, 1989. One of five volumes with proceedings of Structures Congress '89. This collection contains 78 papers on steel structures. Topics include: applications of cable and membrane tension structures; techniques for assessing the reliability and new concepts in design of transmission line structures; stability considerations in design, analysis, and structural optimization; problems in steel structures; bridge and tension structure aesthetics; member design, including bracing members, compression members, steel connections in seismic design, and effects of fabrication on deformation of steel beams. Papers on applications examined latticed structures, cold-formed steel structures, tubular construction, and steel buildings.

Practical Applications of Design Optimization Santiago Hernández 2002 The scientific field of design optimization has evolved tremendously both in terms of theory and of the software available to support it.

Analysis of Deployable Strut Roof Structures Maxwell Henry Wolfe 2013 Deployable structures are structures that can change shape from a compact to an expanded form. Thus, their advantage over conventional structures is adaptability, whether in the sense of adapting to changing environmental conditions or being adapted for repeated transportation and deployment. These features make deployable structure highly

desirable for a wide range of applications in the aerospace, military, and architectural fields. However, these structures are often only designed as small scale "products", rather than structures requiring full analysis and design procedures. Much work has focused on the various geometries of the deployment mechanisms without considering practical engineering aspects. If deployable structures are to be designed on the scale of large civil structures, a proper understanding of the flow of forces through the structure is required. This thesis begins with a brief discussion of deployable structures in general before moving on to geometric constraints of strut-type deployable structures. Then, it details a preliminary analysis of one class of deployable structures, known as angulated element structures. These structures are designed to be operable roofs spanning over sports facilities. During deployment, the center of the structure opens or closes to accommodate changes in weather conditions. Building on the geometry established in other work, the relationships between the basic geometric parameters of angulated element rings and their structural characteristics are determined. SAP2000 analysis results are used to make specific design recommendations. The feasibility of using this type of structure for an operable long span roof is confirmed.

Design of Special Planar Linkages Jingshan Zhao 2013-08-31 Planar linkages play a very important role in mechanical engineering. As the simplest closed chain mechanisms, planar four-bar linkages are widely used in mechanical engineering, civil engineering and aerospace engineering. Design of Special Planar Linkages proposes a uniform design theory for planar four-bar linkages. The merit of the method proposed in this book is that it allows engineers to directly obtain accurate results when there are such solutions for the specified n precise positions; otherwise, the best approximate solutions will be found. This book discusses the kinematics and reachable workspace and singularity of a planar 3-RRR linkage, which can be used to analyze other planar linkages. Then a foldable stair that retains the walking conversions of human beings and all the merits of a concrete stair in civil engineering is described along with a lifting guidance mechanism that has the advantages of high strength, high rigidity, lightweight overconstraint trusses and motion flexibility. The method proposed in this book can be applied to other planar linkages. This book offers a valuable resource for scientists, researchers, engineers, graduate students in mechanical engineering especially those interested in engineering design, robotics and automation. Jingshan Zhao, Associate professor; Zhijing Feng and Fulei Chu, professor; Ning Ma, Dr., all work at the Department of Mechanical Engineering, Tsinghua University.
