Towards Earthquake Resistant Design of Concentrically

Braced Steel Structures Patxi

Uriz 2005 In recent years,

there has been a shift in typical steel construction from moment frames to concentrically braced frames for use in regions of high seismic risk in the United States. Given the large increase in popularity, it is surprising to find that large-scale testing of

subassemblages or components of special concentric braced frames is sparse, particularly with frames containing conventional buckling braces and modern construction

details. Rigorous analytical modeling of structures with proportions and details typical to those used in concentrically braced frames today are also limited. Test validated analytical models are paramount to adequately predict and assess performance of these structures when subjected to severe ground shaking.

Steel Structures Design for Lateral and Vertical Forces, Second Edition Alan Williams

Steel Structures Design for Lateral and Vertical Forces, Second Edition, features start-to-finish engineering strategies that encompass the entire range of steel building materials,

members, and loads. All techniques strictly conform to the latest codes and specifications. A brand new chapter on the design of steel structures for lateral loads explains design techniques and innovations in concentrically and eccentrically braced frames and moment frames. Throughout, design examples, including step-by-step solutions, and end-of-chapter problems using both ASD and LRFD methods demonstrate real-world applications and illustrate how code requirements apply to both lateral and vertical forces.
