2019-06-04 Algorithms are the

essence of programming. After

their construction, they have to

be translated to the codes of a

specific programming

language. There exists a

maximum of ten basic

algorithmic templates. This

textbook aims to provide the

reader with a more convenient

and efficient method to create

a program by translating

algorithms, template by

template with C++ and Java.

This is the slogan of the book:

You will be a professional

programmer whenever you

become a skilled algorithm

designer. This book attempts to

gradually strengthen the

readers' ability to identify and

analyze the mental commands

which are issued and

implemented in their brains for

solving the problems in which

mathematical computations are applied and try to design an algorithm based on their understanding and analyses. It then seeks to encourage the readers to develop their skills in algorithm-writing for computational problems and synchronously teach them to translate the algorithms into C++ and Java codes using the least necessary keywords.
