Climate-Smart Livestock Production: Strategies for Enhanced Sustainability and Resilience Oyegunle Emmanuel Oke 2025-09-08

Climate-smart livestock production is essential for enhancing animal welfare, ensuring food security, and bolstering resilience against climate change as demand for animal-sourced foods grows. This field focuses on identifying sustainable strategies at all production scales, from expansive commercial farms to smaller operations. We seek original research and review articles that detail practices and technologies aimed at reducing greenhouse gas emissions, minimizing water pollution, optimizing land use, and improving animal welfare in livestock systems. The sector faces significant challenges from climate change, including heat stress, water scarcity, and heightened disease risks. Adopting climate-smart practices—such as increasing feed efficiency, streamlining manure management, and utilizing renewable energy—are pivotal in creating more sustainable livestock systems. These efforts must integrate animal welfare to ensure the sustainability and resilience of these enterprises over the long term.

Greenhouse gas accounting in the forestry sector Food and Agriculture Organization of the United Nations 2025-03-03 This report aims to illustrate the methodological improvements for estimating greenhouse gas (GHG) emissions and removals from forest management practices and disturbances implemented in the FAO's Environmental eXternalities Accounting Tool (EX-ACT), an online accounting app that estimates and tracks the outcomes of agricultural interventions on environmental externalities, including GHG emissions. It highlights key updates from the previous tool's version, EX-ACT v.9, and shows the main limitations that have been overcome through a change in methodology. The revision follows the International Panel on Climate Change's Guidelines for National Greenhouse Gas Inventories (2006, 2019). The methodology update now better reflects the effects of various forest management interventions on yearly GHG emissions and reductions, as beforehand the tool only considered overall forest biomass changes over the entire accounting period. The updated EX-ACT online app now provides a more detailed approach, accounting for both positive and negative changes in

forest-carbon stocks, as well as multiple drivers of changes in forest-carbon stocks, including forest management (thinning, logging, reduced impact logging, etc.) and use (timber, fuelwood), as well as disturbances (fire, forest pests and diseases, storms, drought, etc.). A major shift in methodology is the transition from the Stock-Difference approach to the Gain-Loss approach to capture annual changes of forest carbon stocks. The refined methodology improves estimates of GHG emissions and reductions, offering a valuable tool for assessing the climate change mitigation effects of forestry activities in agrifood investment activities, projects, programmes, and policies.
