ANSYS Tutorial Kent L. Lawrence 2012

The eight lessons in this book introduce the reader to effective finite element problem solving by demonstrating the use of the comprehensive ANSYS FEM Release 14 software in a series of step-by-step tutorials. The tutorials are suitable for either professional or student use. The lessons discuss linear static response for problems involving truss, plane stress, plane strain, axisymmetric, solid, beam, and plate structural elements. Example problems in heat transfer, thermal stress, mesh creation and transferring models from CAD solid modelers to ANSYS are also included. The tutorials progress from simple to complex. Each lesson can be mastered in a short period of time, and lessons 1 through 7 should all be completed to obtain a thorough understanding of basic ANSYS structural analysis. The concise treatment includes examples of truss, beam and shell elements completely updated for use with ANSYS APDL 14.

The impact of cutting parameters in the confronting procedure for the most part influences the Tool life and Production time of item. The developing rivalry for higher profitability with great surface finish has made the need of utilizing top notch machining instrument. The significant cutting parameters in confronting process chiefly cutting speed, feed rate, depth of cut influence the Tool life and Production time of the completed material. This paper reviews the streamlining of cutting parameters in confronting process utilizing Taguchi method. An exceptionally structured

symmetrical exhibit of Taguchi is utilized to examine the impact of slicing parameters through the modest number of analyses. Taguchi technique is an integral asset of improvement. ANOVA is utilized to discover which input parameters altogether influence the execution attributes. Sign to Noise (S/N) proportion is utilized to gauge the varieties of test information. 1. INTRODUCTION Turning is a machining procedure used to get the ideal element of round metal. The primary objective in present mechanical period is to create minimal effort quality item with required measurements in an optimum time. Therefore, the optimum cutting parameters are to be perceived first. In turning, the metal is in rotational movement and a cutting tool is utilized to shear away the undesired metals. This procedure requires lathe machine or turning machine, cutting tool, work piece and fixture. The work piece is fixed in the machine chuck and is pivoted at rapid. The cutting tool is taken care of in

corresponding to the hub of turn. During this machining procedure the cutting parameters profoundly relies on the work piece, cutting tool material, and so on. These are dictated by understanding or machine catalogue. Surface roughness, Tool life and machining time is a widely used attribute of product quality and in most cases a technical necessity for mechanical products. Thus the optimum selection of cutting parameters such as feed rate, depth of cut, cutting speed, etc, generates optimum conditions during machining and becomes the main exigency of

manufacturing industry. Surface roughness, Tool life and machining time is an important criterion to find the quality of a surface. It is an important response parameter. In machining process various parameters are: Input Parameters: Cutting speed, Feed rate, Depth of cut, Insert radius, Cutting fluid, etc. Output Parameters: surface roughness, Tool life and machining time.
