Biocatalysis in Asymmetric Synthesis

Gonzalo De Gonzalo 2024-05-04 Biocatalysis in Asymmetric Synthesis, a new volume in the Foundations and Frontiers of Enzymology series, offers an applied discussion of synthesizing biological catalysts using asymmetric synthesis, for applications across research and industry. Here, global experts in the field analyze a wide variety of biocatalysts and their physical states, process conditions for their asymmetric synthesis, solvents required during synthesis, and even downstream procedures for the recovery of final products. The book adopts an interdisciplinary approach, merging fundamental biology and its synthetic applications across industries, with a wide range of practical examples, from directed evolution to biotransformation and production of novel enzymes and non-conventional catalysts. Throughout the book, the impact and application of biocatalysis in sustainable processing is considered in-depth. This book will also help non-experts in biocatalysis to apply this knowledge in their own research, providing a thorough overview of the ways asymmetric biocatalytic approaches may be adapted for different disciplines and downstream products. - Explores biocatalysts as exquisite catalysts for fine chiral compound synthesis in different reaction media - Features both foundational

overviews and applied, practical examples across research and industry - Includes chapter contributions from international leaders in the field

Neurovision: Neural bases of binocular vision and coordination and their implications in visual training programs Olivier A. Coubard

2015-10-12 Binocular vision is achieved by five neurovisual systems originating in the retina but varying in their destination within the brain. Two systems have been widely studied: the retino-tectal or retino-collicular route, which subserves an expedient and raw estimate of the visual scene through the magnocellular pathway, and the retino-occipital or retino-cortical route, which allows slower but refined analysis of the visual scene through the parvocellular pathway. But there also exist further neurovisual systems: the retino-hypothalamic, retino-pretectal, and accessory optic systems, which play a crucial role in vision though they are less understood. The retino-pretectal pathway projecting onto the pretectum is critical for the pupillary or photomotor reflex. The retino-hypothalamic pathway projecting onto the suprachiasmatic nucleus regulates numerous behavioral and biological functions as well as circadian rhythms. The accessory optic system targeting terminal lateral, medial and dorsal nuclei through the paraoptic fasciculus plays a role in head and gaze orientation as well as slow movements. Taken together, these neurovisual systems involve 60% of brain activity, thus highlighting the importance of vision in the functioning and regulation of the central nervous system. But vision is first and foremost action, which makes perception impossible without movement. Binocular coordination is a prerequisite for binocular fusion of the object of interest on the two foveas, thus ensuring visual perception. The retino-collicular pathway is sufficient to elicit reflexive eye movements with short latencies. Thanks to its motor neurons, the superior colliculus activates premotor neurons, which themselves activate motor neurons of the oculomotor, trochlear and abducens nuclei. At a higher level, a cascade of neural mechanisms participates in the control of decisional eye movements. The superior colliculus is controlled by the substantia nigra pars reticulata, which is itself gated by subcortical structures such as the

dorsal striatum. The superior colliculus is also inhibited by the dorsolateral prefrontal cortex through a direct prefrontotectal tract. Cortical areas are crucial for the triggering of eye movements: the frontal eye field, supplementary eye field, and parietal eye field. Finally the cerebellum maintains accuracy. The focus of the present research topic, entitled Neural bases of binocular vision and coordination and their implications in visual training programs, is to review the most recent findings in brain imaging and neurophysiology of binocular vision and coordination in humans and animals with frontally-placed eyes. The emphasis is put on studies that enable transfer of knowledge toward visual training programs targeting visual field defects (e.g., hemianopia) and binocular functional disorders (e.g., amblyopia).

Therapeutic Modulation of the Complement System: Clinical Indications and Emerging Drug Leads John D. Lambris 2020-02-14 The complement system is a multi-tasking gatekeeper of innate immunity that intricately interacts with other key defense systems, such as the endothelial barrier, contact activation and coagulation systems, in maintaining tissue immunosurveillance and homeostasis. Its rapid and forceful activation in the bloodstream not only ensures the effective containment of microbial infections through potent cytolytic mechanisms, but also alerts the

adaptive immune compartment to ensure the mounting of a proper humoral immune response against foreign antigens. However, there is a lurking 'dark side' that can lead complement astray, fueling a self-perpetuating vicious cycle of inflammation, exuberant immune activation and irreversible tissue injury that collectively exacerbate both acute and chronic pathologies. Indeed, complement dysregulation or excessive activation have been widely recognized as key pathogenic drivers in a wide spectrum of inflammatory or immune-mediated diseases. Targeted modulation of the complement system at various points of the cascade has revealed promising therapeutic targets for ameliorating disease scores in a number of conditions ranging from ocular, neurodegenerative and thromboinflammatory disorders, to cancer, periodontal diseases, chronic hemolytic anemias, ischemia-reperfusion organ injury, antibody-mediated transplant rejection and hemodialysis-triggered inflammation. Elegant pre-clinical studies employing a diversified toolbox of highly specific complement inhibitors in rodent or primate models of disease have opened new avenues of therapeutic exploration by providing proof of concept for the therapeutic efficacy of complement modulation. At the same time, the clinical experience gained during this last decade with the sole complement-specific drug currently in the clinic, eculizumab, has rekindled the interest of biopharmaceutical companies in developing new and potent complement therapeutics for complement-driven diseases. In this respect, the complement field is witnessing a new surge of clinical trials that are evaluating the safety, PK/PD profile and clinical efficacy of promising drug candidates in a number of clinical conditions driven by complement imbalance or over-activation.
