Data Security for Health Care SEISMED

Consortium 1996 The efficiency of modern health care relies more and more upon a computerised infrastructure. Open distributed information systems have started to bring professionals together from all over the world. On the one hand easy processing and communication of images, sound and texts will help to visualize and therefore treat illnesses and diseases efficiently, on the other hand the very ease of access and use can threaten patient privacy, accountability and health care professional secrecy. Developments in community care are responsible for the fact that many aspects of patient care are delivered outside the closed walls of a hospital and hence patient records must also be accessible and updated throughout the community. Therefore, the introduction of information technology should focus primarily on the improvement of the health of patients or, at least, not putting patients' health at risk. This means that the right data has to be available to the right person at the right time (availability). Information technology deeply affects the confidential relationship between patient and doctor, since it increasingly surrounds and mediates it. Information systems in health care establishments are increasingly developing towards an integrated system where various users can interact and communicate. The process of integration will cross the borders of local health care establishments and it will progressively expand, e.g., into patients' homes, into a European health care community, in order to support the mobility of patients, the exchange of medical and administrative data, transfer of bills and money.

Database Security Gerardus Blokdyk 2018-01-16 Has the Database security work been fairly and/or equitably divided and

delegated among team members who are qualified and capable to perform the work? Has everyone contributed? To what extent does management recognize Database security as a tool to increase the results? What tools and technologies are needed for a custom Database security project? How do we keep improving Database security? Does Database security systematically track and analyze outcomes for accountability and quality improvement? Defining, designing, creating, and implementing a process to solve a business challenge or meet a business objective is the most valuable role... In EVERY company, organization and department. Unless you are talking a one-time, single-use project within a business, there should be a process. Whether that process is managed and implemented by humans, AI, or a combination of the two, it needs to be designed by someone with a complex enough perspective to ask the right questions. Someone capable of asking the right questions and step back and say, 'What are we really trying to accomplish here? And is there a different way to look at it?' This Self-Assessment empowers people to do just that - whether their title is entrepreneur, manager, consultant, (Vice-)President, CxO etc... - they are the people who rule the future. They are the person who asks the right questions to make Database security investments work better. This Database security All-Inclusive Self-Assessment enables You to be that person. All the tools you need to an in-depth Database security Self-Assessment. Featuring 692 new and updated case-based questions, organized into seven core areas of process design, this Self-Assessment will help you identify areas in which Database security improvements can be made. In using the questions you will be better able to: - diagnose Database security projects, initiatives, organizations, businesses and processes using accepted diagnostic standards and practices - implement evidence-based best practice strategies aligned with overall goals - integrate recent advances in Database security and process design strategies into practice according to best practice guidelines Using a Self-

Assessment tool known as the Database security Scorecard, you will develop a clear picture of which Database security areas need attention. Your purchase includes access details to the Database security self-assessment dashboard download which gives you your dynamically prioritized projects-ready tool and shows your organization exactly what to do next. Security Guide for IBM i V6.1 Jim Cook
2009-05-29 The IBM® i operation system (formerly IBM i5/OS®) is considered one of the most secure systems in the industry. From the beginning, security was designed as an integral part of the system. The System i® platform provides a rich set of security features and services that pertain to the goals of authentication, authorization, integrity, confidentiality, and auditing. However, if an IBM Client does not know that a service, such as a virtual private network (VPN) or hardware cryptographic support, exists on the system, it will not use it. In addition, there are more and more security auditors and consultants who are in charge of implementing corporate security policies in an organization. In many cases, they are not familiar with the IBM i operating system, but must understand the security services that are available. This IBM Redbooks® publication guides you through the broad range of native security features that are available within IBM i Version and release level 6.1. This book is intended for security auditors and consultants, IBM System Specialists, Business Partners, and clients to help you answer first-level questions concerning the security features that are available under IBM. The focus in this publication is the integration of IBM 6.1 enhancements into the range of security facilities available within IBM i up through Version release level 6.1. IBM i 6.1 security enhancements include: - Extended IBM i password rules and closer affinity between normal user IBM i operating system user profiles and IBM service tools user profiles - Encrypted disk data within a user Auxiliary Storage Pool (ASP) - Tape data save and restore encryption under control of the Backup Recovery and Media Services for i5/OS (BRMS) product, 5761-BR1 -

Networking security enhancements including additional control of Secure Sockets Layer (SSL) encryption rules and greatly expanded IP intrusion detection protection and actions. DB2® for i5/OS built-in column encryption expanded to include support of the Advanced Encryption Standard (AES) encryption algorithm to the already available Rivest Cipher 2 (RC2) and Triple DES (Data Encryption Standard) (TDES) encryption algorithms. The IBM i V5R4 level IBM Redbooks publication IBM System i Security Guide for IBM i5/OS Version 5 Release 4, SG24-6668, remains available.
