Security Guide for IBM i V6.1 Jim Cook 2009-05-29 The IBM® i operation system (formerly IBM i5/OS®) is considered one of the most secure systems in the industry. From the beginning, security was designed as an integral part of the system. The System i® platform provides a rich set of security features and services that pertain to the goals of authentication, authorization, integrity, confidentiality, and auditing. However, if an IBM Client does not know that a service, such as a virtual private network (VPN) or hardware cryptographic support, exists on the system, it will not use it. In addition, there are more and more security auditors and consultants who are in charge of implementing corporate security policies in an organization. In many cases, they are not familiar with the IBM i operating system, but must understand the security services that are available. This IBM Redbooks® publication guides you through the broad range of native security features that are available within IBM i Version and release level 6.1. This book is intended for security auditors and consultants, IBM System Specialists, Business Partners, and clients to help you answer first-level questions concerning the security features that are available under IBM. The focus in this publication is the integration of IBM 6.1 enhancements into the range of security facilities available within IBM i up through Version release level 6.1. IBM i 6.1 security enhancements include: - Extended IBM i password rules and closer affinity between normal user IBM i operating system user profiles and IBM service tools user profiles - Encrypted disk data within a user Auxiliary Storage Pool (ASP) - Tape data save and restore encryption under control of the Backup Recovery and Media Services for i5/OS (BRMS) product, 5761-BR1 - Networking security enhancements including additional control of Secure Sockets Layer (SSL) encryption rules and greatly expanded IP intrusion detection protection and actions. DB2® for i5/OS built-in column encryption expanded to include support of the Advanced Encryption Standard (AES) encryption algorithm to the already available Rivest Cipher 2 (RC2) and Triple DES (Data Encryption Standard) (TDES) encryption algorithms. The IBM i V5R4 level IBM Redbooks publication IBM System i Security Guide for IBM i5/OS Version 5 Release 4, SG24-6668, remains available. [Technical guidelines](#) 1996

Data Security for Health Care SEISMED Consortium 1996 The efficiency of modern health care relies more and more upon a computerised infrastructure. Open distributed information systems have started to bring professionals together from all over the world. On the one hand easy processing and communication of images, sound and texts will help to visualize and therefore treat illnesses and diseases efficiently, on the other hand the very ease of access and use can threaten patient privacy, accountability and health care professional secrecy. Developments in community care are responsible for the fact that many aspects of patient care are delivered outside the closed walls of a hospital and hence patient records must also be accessible and updated throughout the community. Therefore, the introduction of information technology should focus primarily on the improvement of the health of patients or, at least, not putting patients' health at risk. This means that the right data has to be available to the right person at the right time (availability). Information technology deeply affects the confidential relationship between patient and doctor, since it increasingly surrounds and mediates it. Information systems in health care establishments are increasingly developing towards an integrated system where various users can interact and communicate. The process of integration will cross the borders of local health care establishments and it will progressively expand, e.g., into patients' homes, into a European health care community, in order to support the mobility of patients, the exchange of medical and administrative data, transfer of bills and money.
