Evolution, Time, Production, and the Environment Malte Michael Faber 1990 Long-run interactions between the economy and the natural environment are studied from all points of view. First, the aims of this overview are illustrated in Part I. Part II then explores and develops the concept of evolution, in particular distinguishing between evolution which does not involve the emergence of novelty, and evolution where novelty does occur. In Part III three types of time irreversibility are developed, and these concepts are used to show how time has been treated in the natural sciences, also typifying various schools of economic thought. Part IV is concerned with the economic modelling of these concepts. It extends and adapts neo-Austrian capital theory to provide a basis for the modelling of long-run economy-environment interactions. A heuristic simulation model is described, and its simulation results discussed. Part V draws some lessons from the earlier discussion and analysis. It also stresses the role and the importance of interdisciplinary work for the understanding of relationships between economic activity and the natural environment.

Evolution and Selection of Quantitative Traits Bruce Walsh 2018-06-21 Quantitative traits-be they morphological or physiological characters, aspects of behavior, or genome-level features such as the amount of RNA or protein expression for a specific gene-usually show considerable variation within and among populations. Quantitative genetics, also referred to as the genetics of complex traits, is the study of such characters and is based on mathematical models of evolution in which

many genes influence the trait and in which non-genetic factors may also be important. Evolution and Selection of Quantitative Traits presents a holistic treatment of the subject, showing the interplay between theory and data with extensive discussions on statistical issues relating to the estimation of the biologically relevant parameters for these models. Quantitative genetics is viewed as the bridge between complex mathematical models of trait evolution and real-world data, and the authors have clearly framed their treatment as such. This is the second volume in a planned trilogy that summarizes the modern field of quantitative genetics, informed by empirical observations from wide-ranging fields (agriculture, evolution, ecology, and human biology) as well as population genetics, statistical theory, mathematical modeling, genetics, and genomics. Whilst volume 1 (1998) dealt with the genetics of such traits, the main focus of volume 2 is on their evolution, with a special emphasis on detecting selection (ranging from the use of genomic and historical data through to ecological field data) and examining its consequences.

Human Genetics Ricki Lewis 2010 Explains what genes are, how they function, how they interact with the environment, and how our understanding of genetics has changed since completion of the human genome project.

Fundamentals of Genetics Peter J. Russell 2000 Fundamentals of Genetics, Second Edition, provides a concise, easy-to-read introduction to genetics. Based on the author's best-selling Genetics, Fifth Edition, the text is carefully crafted to present full coverage of the subject without overwhelming students with details and complex explanations. A friendly writing style complements Russell's effective, step-by-step problem-solving approach, which guides students to an understanding of principles and concepts. Fundamentals of Genetics, Second Edition, is particularly ideal for students who have a limited background in biology or chemistry, or for briefer courses in which there is little time for advanced topics. A greatly expanded supplements package now accompanies the text.

Evolutionary Ecology of Marine Invertebrate Larvae Tyler J. Carrier 2018 Marine invertebrate larvae are an integral part of pelagic diversity and have stimulated the curiosity of researchers for centuries. This book integrates the latest research in order to provide a modern synthesis of this interdisciplinary field.

Narrow Roads of Gene Land: Volume 2: Evolution of Sex William Donald Hamilton 1996 The second volume of the collected papers of W D Hamilton, the most important theoretical biologist of the 20th century. Volume 1, The Evolution of Social Behaviour (OUP, still in print), was devoted to the first half of Hamilton's life's work; Volume 2 is devoted to the other half, on sex and sexual selection. Each paper is accompanied by a specially-written autobiographical introduction.

Human Heredity Michael R. Cummings 1997 This introduction to human heredity/genetics for the non-science major requires no previous exposure to biology, chemistry, or mathematics. It covers the latest research and technological advances in human genetics and the implications of this knowledge on the human condition (social, cultural, and ethical). Now full-color throughout, the Fourth Edition includes significant content revision and features chapter opening prologues, more clinical material woven throughout the text, and less technical jargon. Short case studies and Internet activities end many chapters, and end-of-chapter exercise sets are new.

Genetic: A Conceptual Approach Benjamin A. Pierce 2013-12-27 With Genetics: A Conceptual Approach, Ben Pierce brings a master teacher's experiences to the introductory genetics textbook, clarifying this complex subject by focusing on the big picture of genetics concepts and how those concepts connect to one another.

Principles of Genetics D. Peter Snustad 2000 The cover shows many facets of genetics. Top row, Left: The DNA double-helix, here imaged in a scanning tunneling micrograph, is central to all genetics research. Right:

Experimentation has shown that some social behaviors, such as nest cleaning by honeybees, is under genetic control. Second row, Left: Inherited disorders such as albinism, manifested here in a bullfrog, have provided many insights about the genetic control of metabolism. Right: Gregor Mendel's 19th-century work with pea plants elucidated the basic principles of inheritance. Third row, Left: Efforts to combat HIV, the virus that causes AIDS, depend on knowing how the virus expresses its genes inside the cells of the immune system. Right: The fruit fly is ideally suited for studies on the genetic control of embryonic development and organ formation. Fourth row, Left: The identification of mutations that cause unregulated cell division facilitates the diagnosis, treatment, and prevention of breast cancer. Right: HeLa cells, derived in 1951 from Henrietta Lacks, a woman who died of cervical cancer, thrive in the laboratory and are used in research worldwide.
