*Current Advances in Distributed Computing and Communications* Yechiam Yemini 1987 This book grew out of a series of seminars presented by the authors to the Distributed Computing and Communications (DCC) group and others at Columbia University. Seminal ideas were encouraged by seminar participants at the possible expense of full maturity. The value of the concepts and not their full refinement was the primary goal so that state-of-the-art research problems could be addressed. This book is divided into two fairly loose sections. The first covers research in the area of performance analysis of distributed systems. The second deals with the areas of distributed processes and their communications, parallel

systems, and VLSI systems.

comprehensive and clearly structured book presents essential information on modern Location Science. The book is divided into three parts: basic concepts, advanced concepts and applications. Written by the most respected specialists in the field and thoroughly reviewed by the editors, it first lays out the fundamental problems in Location Science and provides the reader with basic background information on location theory. Part II covers advanced models and concepts, broadening and expanding on the content presented in Part I. It provides the reader with important tools to help them understand and solve real-world location problems. Part III is dedicated to linking Location Science with other areas like GIS, telecommunications, healthcare, rapid transit networks, districting problems and disaster events, presenting a wide range of applications. This part enables the reader to understand the role of facility location in such areas, as well

as to learn how to handle realistic location problems. The book is intended for researchers working on theory and applications involving location problems and models. It is also suitable as a textbook for graduate courses on facility location.

**Facility Location** Zvi Drezner  
2001-11-20 The book covers both theory and applications of locational analysis (LocAn). The reader will see the power of LocAn models in various real-world contexts, varying from communication design to robotics and mail delivery. It is divided into two parts. The first part contains an overview of some of the LocAn methodologies. The second part describes in thorough detail some selected applications. The text provides researchers with an excellent and well thought-out review of available location models.

The total of 119 papers selected for the proceedings were carefully reviewed and selected from 297 submissions.

Concentrator Location in Telecommunications Networks

**Routing, Flow, and Capacity**

**Design in Communication and Computer Networks** optimization

Michal Pioro 2004-07-21 In network design, the gap between theory and practice is woefully broad. This book narrows it, comprehensively and critically examining current network design models and methods. You will learn where mathematical modeling and algorithmic optimization have been under-utilized. At the opposite extreme, you will learn where they tend to fail to contribute to the twin goals of network efficiency and cost-savings. Most of all, you will learn precisely how to tailor theoretical models to make them as useful as possible in practice. Throughout, the authors focus on the traffic demands encountered in the real world of network design. Their generic approach, however, allows problem formulations and solutions to be applied across the board to virtually any type of backbone communication or computer network. For beginners, this book is an excellent introduction. For seasoned

professionals, it provides immediate solutions and a strong foundation for further advances in the use of mathematical modeling for network design. - Written by leading researchers with a combined 40 years of industrial and academic network design experience. - Considers the development of design models for different technologies, including TCP/IP, IDN, MPLS, ATM, SONET/SDH, and WDM. - Discusses recent topics such as shortest path routing and fair bandwidth assignment in IP/MPLS networks. - Addresses proper multi-layer modeling across network layers using different technologies—for example, IP over ATM over SONET, IP over WDM, and IDN over SONET. - Covers restoration-oriented design methods that allow recovery from failures of large-capacity transport links and transit nodes. - Presents, at the end of each chapter, exercises useful to both students and practitioners.

Simulation and Optimization of Large Systems Andrzej

Osiadacz 1988 Theoretical problems of simulation and optimization  
Optimization of large-scale systems are the subject of this collection of papers. The contributors discuss the practical implementation of these systems in such areas as gas networks, power systems, telecommunication networks, chemical plants, the aerospace industry, and meteorology. The specialized techniques described here have been developed to find methods of solution that can be computed at realistic cost while taking into account the special properties of particular large systems. An up-to-date survey of the subject for engineers and numerical analysts whose work involves large-scale systems.
